

NEW LEAF ENVIRONMENTAL

July 23, 2024

**Certified Arborist Assessment
13100 SW 80 Ave, Pinecrest, Florida
NLE Project No. 52124001**

New Leaf Environmental, LLC (NLE) is providing this report as a record of our assessment of the trees within the above referenced property. This assessment was conducted by an International Society of Arboriculture Certified Arborist in general accordance with the ANSI A300 Standards for Tree Risk Assessment and associated Best Management Practices (BMP) companion book, for a Level 1 (Limited Visual) Assessment. This assessment is not intended to serve for purposes other than tree permitting for site redevelopment. Trees on the site were identified and assessed in July of 2024 and recorded on a tree table (attached). Photos were taken of each tree and included on the attached photo log.

This assessment is valid for the time at which it was written, and changing site conditions, proposed development, and changes in tree health may affect the future validity of this assessment. This assessment does not cover trees other than those listed on the tree table. Trees on site that are exempt from permitting (by classification of species) and woody plants that do not meet the size requirements to be classified as a tree are not typically included with this assessment, but selected individuals may be included to avoid confusion/clarify regulatory status and to provide consistency with survey data.

Project Background & General Site Description

Development activities are being proposed within this property. The current evaluation of trees onsite is intended to assist with identification of trees to be retained, removed, or relocated as part of proposed property improvements. The adjacent aerial depicts an overhead view of the property, with approximate property boundaries.

Condition Ratings

Assigned condition ratings follow the categories described in the 10th edition for Plant Appraisal:

Excellent – nearly perfect vigor and health, free of defects.

Good - no significant damage, normal vigor, any defects or health problems are minor/affect only small branches. Function and aesthetics not compromised.

Fair – reduced vigor, significant damage/defects in up to 50% of the crown though the defects are unlikely to be fatal. Function and aesthetics are compromised.

Poor – unhealthy/in a state of decline, overmature, or severely stressed. Poor vigor. Poor foliage density/color. Defects cannot be detected and are anticipated to contribute to death of the tree. Significant effects on the function and aesthetics of the tree.

Very Poor – tree is effectively dead, though some living foliage may be present. Little to no function.

Dead - tree completely dead. Stumps are recorded when observed and appear to have been cut/tree fallen within the last 3-6 months.

Special Classification

In addition to the condition ratings, the following special classification is noted as applicable:

Non-viable trees are identified as trees which do not currently qualify as High Risk but may be considered as “dead” or effectively destroyed for regulatory purposes - they cannot continue to grow to a reasonably typical form in their current location/condition, and cannot be restored or relocated. Examples are trees with a fatal, non-treatable pathogen, trees that have fallen over but continue to grow, and trees growing overtop of infrastructure elements where their removal is required to comply with mandatory infrastructure maintenance and relocation is infeasible.

Measurements were recorded as follows:

Heights were measured using a digital range finder/hypsometer when a clear line of sight was available, and otherwise visually approximated. Heights were recorded to the nearest foot up to 20 feet, and in five-foot increments above 20 feet. The height of a canopy was considered the top of the main contiguous area of leaves, and does not include solitary branches that may protrude above this level. Diameter at breast height (DBH) was measured using a diameter tape (where possible), and rounded to the nearest inch, except when rounding up or down would change the regulatory status of the tree. Trees with multiple stems at 4.5 feet are measured with a single diameter at caliper height (6 inches) where possible, and otherwise are calculated by the sum of the squares for the diameter of each stem at 4.5 feet. Canopy width measurements are approximated based on field observations and aerial photography, and intended to demonstrate the average diameter of the canopy.

Sincerely,

New Leaf Environmental, LLC

Michael McCoy
